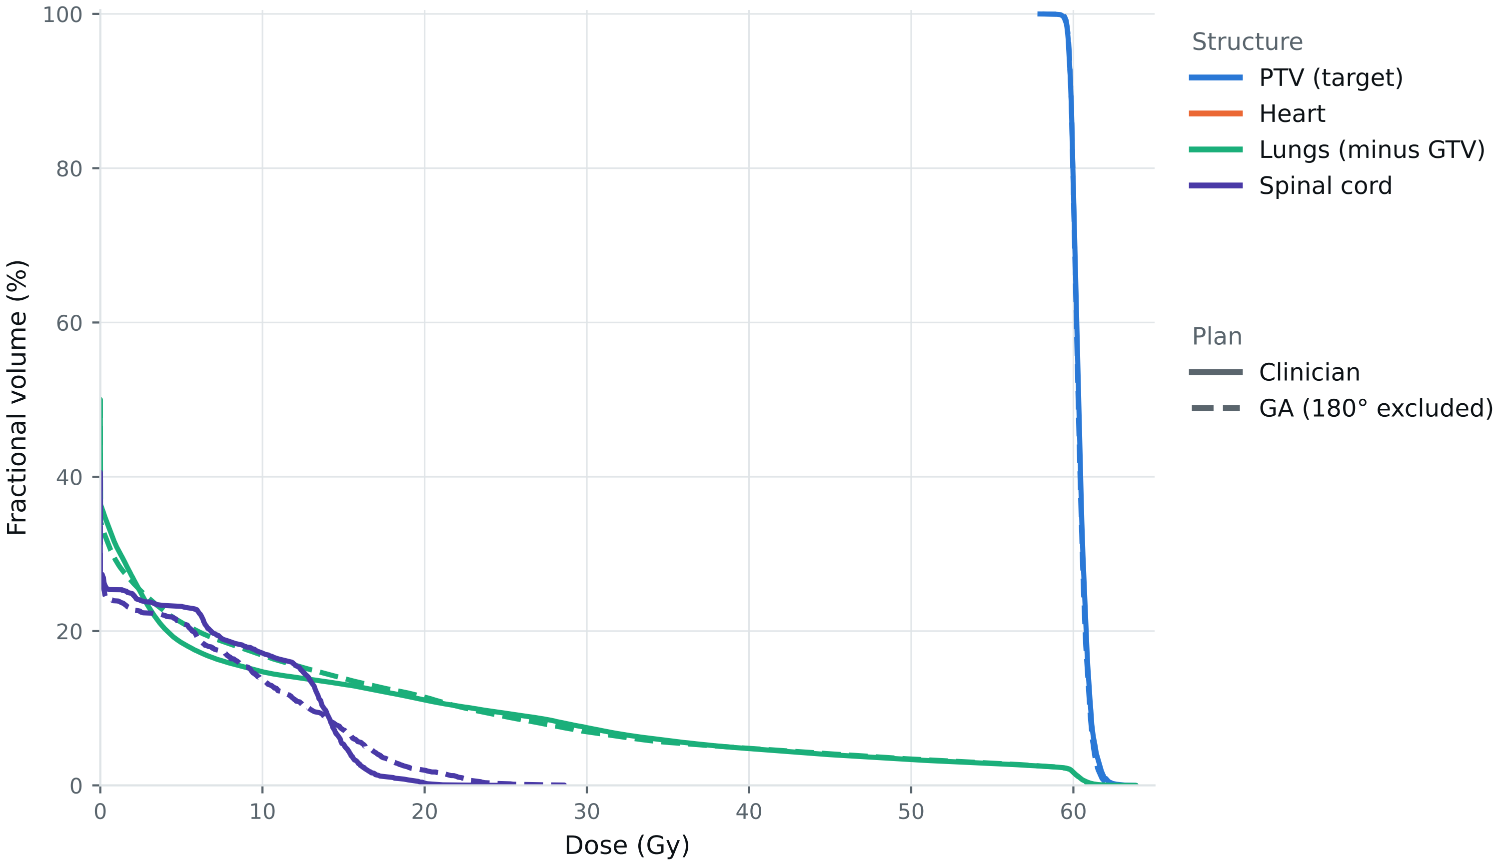
# Dose-volume histogram — Lung_Patient_3

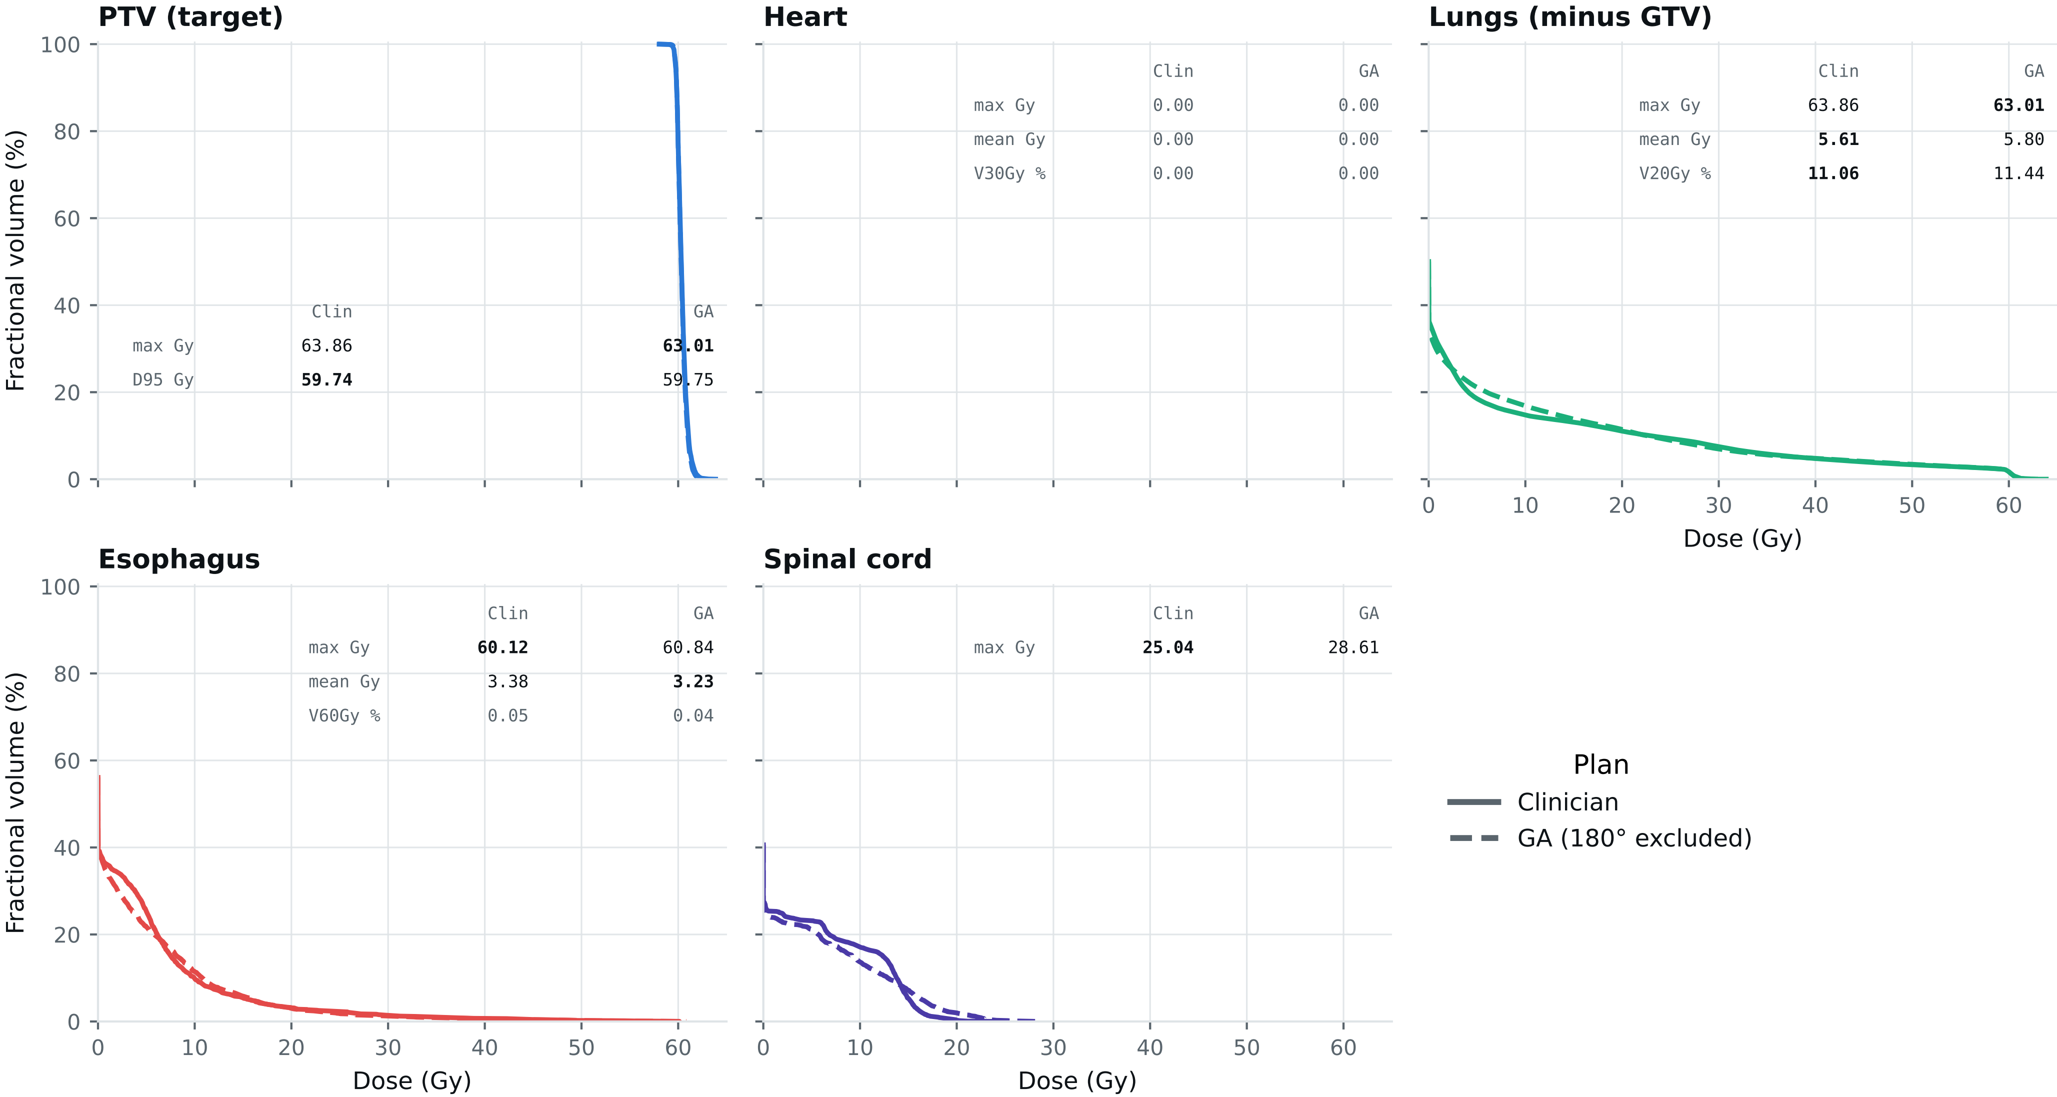
Clinician plan vs. GA (180° excluded). A curve further left and lower means less dose to that structure.



Curves further left are better for organs; the PTV curve should stay high, then drop sharply.
Target curves should overlap; organ curves show the tradeoffs. Esophagus is on page 2.

# DVH by structure — Lung_Patient_3

Same curves, one structure per panel, all plans, each annotated with that structure's protocol metrics.
Bold = best plan; grey = all plans are within 0.01 of each other, so the row carries no signal. Amber misses a goal, red exceeds a limit.



# Clinical criteria — Lung_Patient_3

Lung_2Gy_30Fx protocol. Every criterion is a ceiling, so lower is better; bold marks the best plan.

Grey rows: all plans agree within 0.01 — heart, lung and LUNGS_NOT_GTV max sit at 66 Gy because those structures abut the target. Amber misses the goal; red exceeds the limit.
